

Space-Ship Titanic Analysis

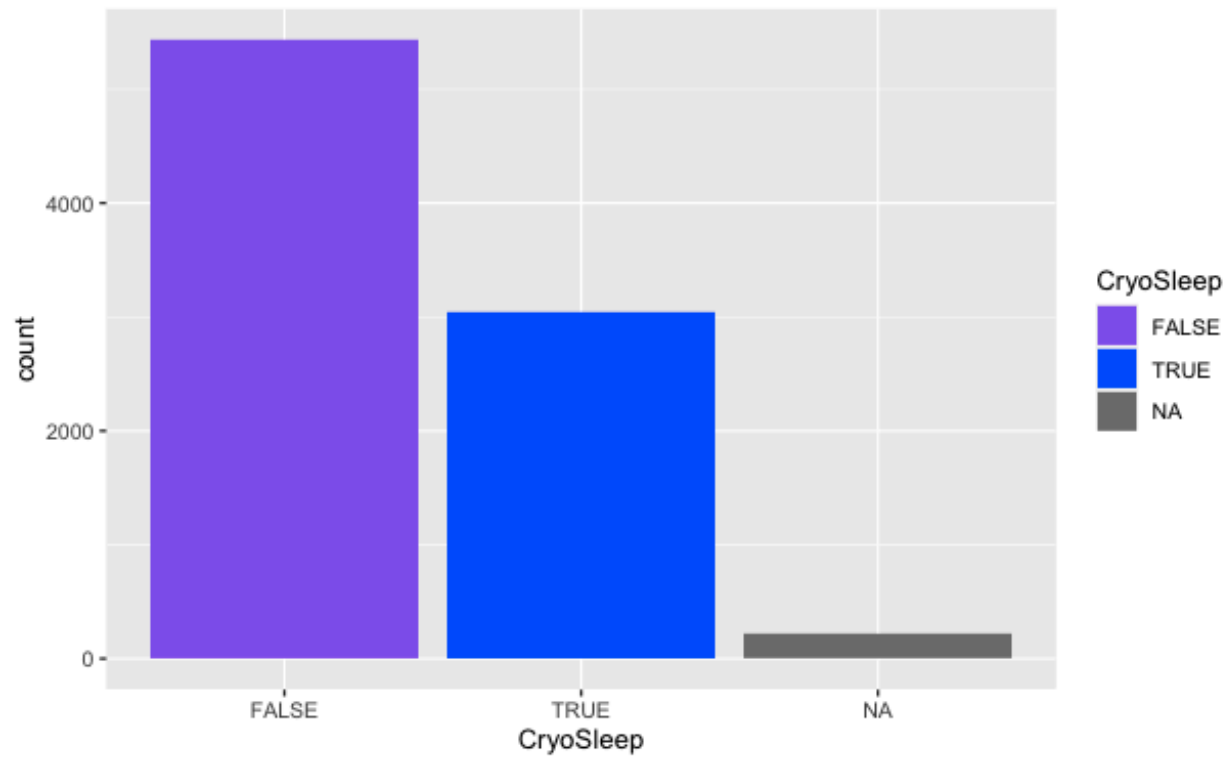

The following graph represents the ages aboard the ship. Looking at the data you can see the majority of people on this ship are between the ages of 18 - 40.

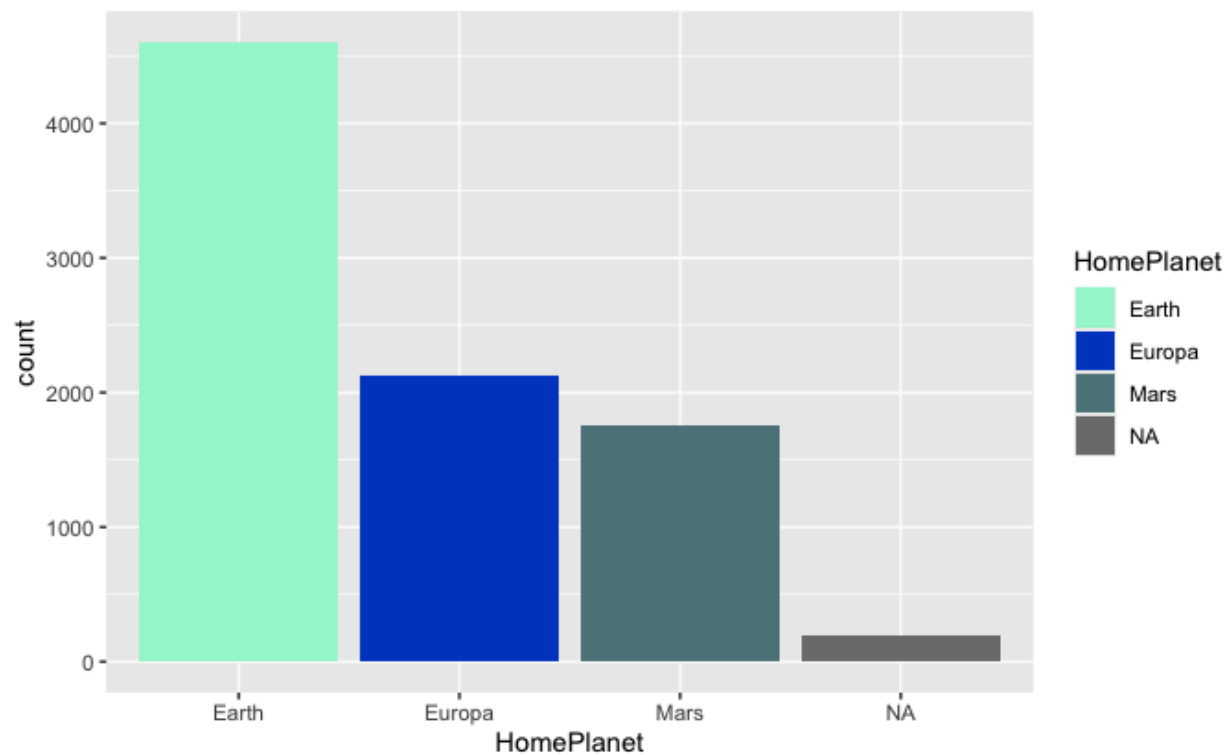

This next set of graphs represents how much the passengers spend their money, which is not a lot and the data is exceptionally skewed.

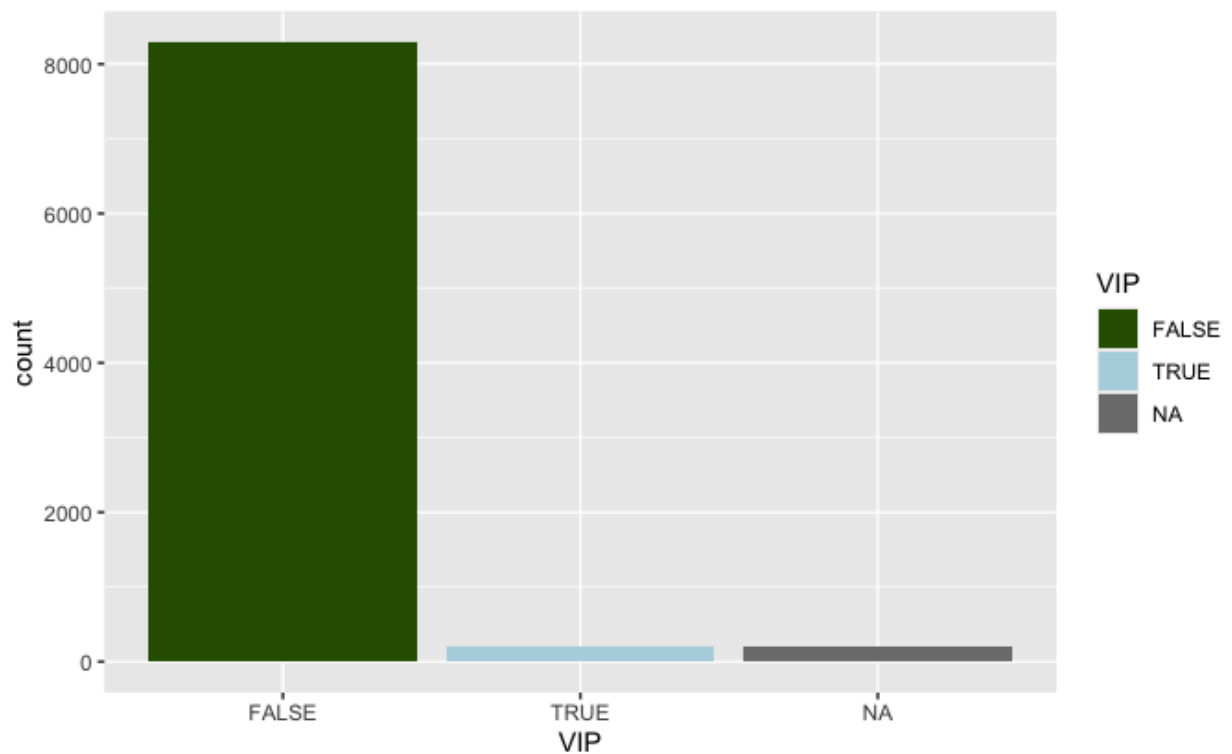

This next bar chart shows how many of the passenger are in Cryo-Sleep, which is well over 50%.

This bar chart represent where the bulk of the passengers are traveling from, most are from Earth.

You can see above that the majority of the passengers are not in the VIP sections.

My final conclusion is that Earth had the most passengers traveling, but Europa had the highest percentages actually Transported which is at 66%, compared to Mars which is at 42%, and finally Earth comes in at 42%. We can also come to the conclusion that people who are in Cryo-Sleep, departing from Europa, and are not VIP are more likely to be transported
